

Help

English reference guide for the Semantra UI.

Help for the Semantra UI

This document is a practical guide to the current Semantra Streamlit product surface. It is not a full button-by-button reference. Instead, it explains how the main workflows fit together.

Main navigation

Semantra currently has five top-level areas:

- Workspace
- Catalog
- Benchmarks
- System
- Governance

Quick terminology note:

- Canonical Console is still a key governance surface, but it now lives inside Governance rather than as a separate top-level tab
- System is the operational successor to the older Admin / Debug description

Recommended order for a new session:

- start in Workspace
- move to Governance (Canonical Console) only if you need canonical governance or overlay work
- use Catalog when you want reuse or discovery
- use Benchmarks when you want repeatable quality measurement
- use System for runtime, observability, and support tasks

Sidebar controls

The left sidebar is now a multi-view support surface controlled by Sidebar view .

Available sidebar views:

- System for connection settings, runtime status, KPI metrics, and the unified status legend
- WS Copilot for read-only Workspace context plus bounded question/answer guidance and conversation history
- WS Brief for a compact Now / Risks / Next actions readout of the current Workspace state
- Help for this in-app English reference guide
- Reference for deeper technical reference documents loaded from docs/reference plus selected presentation references

System

System is the operational sidebar view. It includes:

- API Base URL
- Admin Token
- Runtime
- Operations
- Unified Status Legend
- Reset flow

API Base URL

Semantra - Data Mapping Review and Benchmarking

Upload CSV / JSON / XML / XLSX / SQL → Select Tables → Review Mapping

ACTIVE

1. Upload

Provide source and target CSV, JSON, XML, XLSX, or SQL files.

PENDING

2. Profile

Confirm schema summary and SQL table selection.

PENDING

3. Review

Edit mapping decisions, preview output, and save corrections.

- Workspace
- Catalog
- Benchmarks
- System
- Governance

Workspace flow: Run Setup → Review → Decisions → Output in sequence. Preview stays advisory, while code generation remains governance-gated.

Dismiss

- Setup
- Review
- Decisions
- Output

1. Upload

Any row-based format can map to any other row-based format across CSV, JSON, XML, and XLSX.

Mapping mode

- Standard
- Canonical

Source file

Upload

200MB per file • CSV, JSON, XML, XLSX, SQL

Target file

Upload

200MB per file • CSV, JSON, XML, XLSX, SQL

2. Interpret Files

3. Select Tables

Source upload is row-based (CSV/JSON/XML/XLSX) or single-table SQL.

Target upload is row-based (CSV/JSON/XML/XLSX) or single-table SQL.

Upload and profile

Upload and profile both datasets to unlock review, decision, and output sections.
